Default max-drop result in the BioseqDB natural-path shadow
4.5-Mbp primary arm (N ≤ 4000)

0.000%

0 of 2,869,628 searches
crossed D=500

ZERO IN ALL 779 N×divergence cells

Exact aggregate counter	4,674 inputs
Executed backtracking searches	2,869,628
Natural predecessor visits	255,965,133
D=500 predicate checks	255,965,133
Productive searches	0
Saved predecessor visits	0

Benefit numerator is zero while the drop predicate is checked on every natural visit.

Exact counters are pooled only after every generated input is evaluated separately; this is algorithmic work, not timed speedup. Source SHA-256 b1d2660ef90a...
